SPREADER CALIBRATION

1. Weigh a 5 gallon pail
2. Place spreader on pail so spinner is enclosed
3. Run spreader for one minute with engine on (spreader speed is slower with battery only)
4. Weigh pail and subtract weight of pail to get spread rate per minute.

TIP 1

If you have a handheld GPS use it to determine your speed if you don't have a speedometer

TIP 2

SPEED CALIBRATION

Speed is important to know not only for safe operation of the Best Outdoors Packer Maxx[®] clp but is useful when using a broadcast spreader with your tow vehicle for fertilizing and seeding. One MPH equals approximately 1.5 feet per second (fps), so 2 MPH= 3 fps, 3MPH = 4.5 fps and so on. 5MPH= 7.5 fps. Mark a start line, take twelve long paces (36 ft), mark a finish. Time your tow vehicle start to finish and note the throttle position. You should cover this distance in about 5 seconds for 5MPH, 8 seconds for 3 MPH.
